## USER GUIDE · BEAM CLAMPS FOR CH100-2T & CH100-3

Mekano® - Beam Clamps

## **INTENDED USE**

Beam clamps for providing vertical support directly from structural beams without drilling or other hot-works. The design allows for future adjustment and relocation.

The clamps are suitable with CH100-2T as a traverse beam, or with a standard traverse.

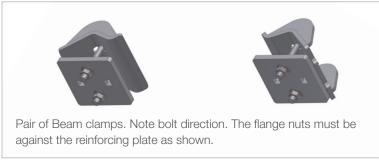

The standard traverse beam is suitable for CH100-3 as a vertical support.

The clamps and traverse beam shown can accomodate flange widths from 100 - 350 mm, and up to 30 mm thickness.

## INSTRUCTION FOR USE

Fit the traverse beam equally across the structural beam using the beam clamps.

Adjust the position and tighten securely with self locking bolts.

Traverse beam clamp with CH100-3 fitted. Ensure that the reinforcing plate is fitted so the width matches the top clamp.
