

INTENDED USE

Flexi Risers are used to route ladders through irregular spaces and are designed to be used as both inside and outside risers. Multiple risers can be combined together to create any radius and give full flexibility. The combination of the 9 and 10 circular/square holes give adjustment possibilities in steps of 4°.

Note! Make sure that round holes correspond with square holes when installing.

INSTRUCTION FOR USE

When fitting, ensure the square holes are on the inside and the splice notches fit into the slots. One splice must then be fitted on the inside of the ladder rail, and one on the outside.

Assemble loosely. Use only the centre bolt in each of the hinge joints until the angle is set. Adjust to fit and add the second bolt in the hole available.
